## OXAMIC ACIDS AND DERIVATIVES AS THYROID RECEPTOR LIGANDS

## FIELD OF THE INVENTION

The present invention relates to novel thyroid receptor ligands and, more particularly, relates to novel oxamic acids, and derivatives thereof, which are useful in the treatment of obesity, hyperlipidemia, thyroid disease, hypothyroidism and related disorders and diseases such as diabetes mellitus, atherosclerosis, hypertension, coronary heart disease, hypercholesteremia, depression and osteoporosis. Also provided are methods, pharmaceutical compositions and kits for treating such diseases and disorders.

## BACKGROUND OF THE INVENTION

10 It is generally accepted that thyroid hormones, specifically, biologically active iodothyronines, are critical to normal development and to maintaining metabolic homeostasis. Thyroid hormones stimulate the metabolism of cholesterol to bile acids and enhance the lipolytic responses of fat cells to other hormones.

Thyroid hormones also affect cardiac function both directly and indirectly, e.g.,  
15 by increasing the metabolic rate. For example, tachycardia, increased stroke volume,  
increased cardiac index, cardiac hypertrophy, decreased peripheral vascular  
resistance and increased pulse pressure are observed in patients with  
hyperthyroidism.

Disorders of the thyroid are generally treated with hormone replacement by administering either naturally occurring thyroid hormones or thyromimetic analogues thereof which mimic the effects of thyroid hormones.

Two naturally occurring thyroid hormones, namely, thyroxine or 3,5,3',5'-tetraiodo-L-thyronine (commonly referred to as "T<sub>4</sub>") and 3,5,3'-triiodo-L-thyronine (commonly referred to as "T<sub>3</sub>"), are shown below:

30  $T_3$  is the more biologically active of the two and, as will be appreciated from the structural formulae provided above, differs from  $T_4$  by the absence of the 5' iodine.

$T_3$  may be produced directly from the thyroid gland, or, in peripheral tissues, by the removal of the 5' iodine by delodinase enzymes. Thyromimetic analogs are often designed to be structurally similar to  $T_3$ . In addition, naturally occurring metabolites of  $T_3$  are known.

- 5 As discussed above, thyroid hormones affect cardiac functioning, for example, by causing an increase in the heart rate and, accordingly, an increase in oxygen consumption. While the increase in oxygen consumption may result in certain desired metabolic effects, nonetheless, it does place an extra burden on the heart, which in some situations, may give rise to damaging side effects. Therefore, as is known in the art, such as described by A.H. Underwood *et al.* in an article published in *Nature*, Vol. 324: pp. 425-429 (1986), efforts have been made to synthesize thyroid hormone analogs which function to lower lipids and serum cholesterol without generating the adverse cardiac effects referred to above.

- 10 U.S. Patent Nos. 4,766,121; 4,826,876; 4,910,305; and 5,061,798 disclose certain thyroid hormone mimetics, namely, 3,5-dibromo-3'-[6-oxo-3(1H)-pyridazinylmethyl]-thyronines.

- 15 U.S. Patent No. 5,284,971 discloses certain thyromimetic cholesterol lowering agents, namely, 4-(3-cyclohexyl-4-hydroxy or -methoxy phenylsulfonyl)-3,5 dibromo-phenylacetic compounds.

- 20 U.S. Patent Nos. 5,401,772; 5,654,468; and 5,569,674 disclose certain lipid lowering agents, namely, heteroacetic acid derivatives, which compete with radiolabeled  $T_3$  in binding assays using rat liver nuclei and plasma membrane preparations.

- Certain oxamic acids and derivatives thereof are known in the art, e.g., U.S. Patent No. 4,069,343 describes the use of certain oxamic acids to prevent immediate type hypersensitivity reactions; U.S. Patent No. 4,554,290 describes the use of certain oxamic acids to control pests on animals and plants; U.S. Patent No. 5,232,947 describes the use of certain oxamic acids to improve damaged cerebral functions of the brain; and European Patent Specification published as EP 580,550 discloses certain oxamic acid derivatives as hypocholesteremic agents.

- 30 In addition, certain oxamic acid derivatives of thyroid hormones are known in the art. For example, N. Yokoyama *et al.* in an article published in the *Journal of*

6012292.030199

- Medicinal Chemistry, 38 (4): 695-707 (1995) describe replacing a  $-CH_2$  group in a naturally occurring metabolite of  $T_3$  with an  $-NH$  group resulting in  $-HNCOCO_2H$ . Likewise, R.E. Steele et al. in an article published in International Congressional Service (*Atherosclerosis* X) 1066: 321-324 (1995) and Z.F. Stephan et al. in an article published in *Atherosclerosis*, 126: 53-63 (1996), describe certain oxamic acid derivatives useful as lipid-lowering thyromimetic agents yet devoid of undesirable cardiac activities.

Certain isotopically-labelled compounds of the present invention, for example those into which radioactive isotopes such as  $^3\text{H}$  and  $^{14}\text{C}$  are incorporated, are useful in drug and/or substrate tissue distribution assays. Tritiated, i.e.,  $^3\text{H}$ , and carbon-14, i.e.,  $^{14}\text{C}$ , isotopes are particularly preferred for their ease of preparation and detectability. Further, substitution with heavier isotopes such as deuterium, i.e.,  $^2\text{H}$ , can afford certain therapeutic advantages resulting from greater metabolic stability, for example increased *in vivo* half-life or reduced dosage requirements and, hence, may be preferred in some circumstances. Isotopically-labelled compounds of Formula I of this invention and prodrugs thereof can generally be prepared by carrying out the procedures disclosed in the SCHEME and/or in the EXAMPLES below, by substituting a readily available isotopically-labelled reagent for a non-isotopically labelled reagent.

The starting materials for each synthetic SCHEME and EXAMPLE provided by this description are either commercially available or can be prepared according to methods known to those skilled in the art such as described, for example, in the aforementioned U.S. Patent Nos. 5,401,772; 5,569,674; and 5,654,468, and European Patent Specification published as EP 580,550.

The compounds of the present invention can be prepared from a common intermediate **1** as described below

25

which itself may be synthesized according to any suitable method known in the art. More specifically, those skilled in the art will understand based upon the present disclosure how to prepare the common intermediate **1** wherein W is oxygen,  $(\text{SO}_2)_x$ .

CH<sub>2</sub> or NR<sup>9</sup> where d and R<sup>9</sup> are as described above. It is particularly preferred that W is oxygen.

For example, common intermediate 1 wherein W is oxygen ("1(a)") can be prepared by either

By SCHEME A:

The nitro intermediate A can be converted to the 3'-sulfonamide 7 or 8 by reaction of a 3'-chlorosulfonylated intermediate of A and a primary or secondary amine in a suitable solvent such as, for example, dichloromethane, THF, MeOH, EtOH or acetonitrile, in the presence of a suitable base such as, for example, TEA or diisopropylethylamine. Chlorosulfonylation of A can be performed by stirring a solution of A in a neat chlorosulfonic acid at from about 0°C to about 25°C.

The sulfonamide 7 can be converted to the sulfonamide 8 by alkylation. A preferred alkylation method uses a suitable alkylated agent such as, for example, an alkyl halide, in the presence of a suitable base such as, for example, potassium carbonate, sodium hydride, potassium t-butoxide, NaOH or KOH, in a suitable organic solvent such as, for example, acetone, THF, DMSO, 2-propanol or an aqueous MeOH solution.

Demethylation of 8 to the phenol 9 can be accomplished by reaction of 8 with a suitable boron trihalide such as, for example, boron tribromide or boron trichloride, in a suitable organic solvent such as, for example, dichloromethane or chloroform.

Nitro reduction of 9 to the aniline 10 can be effected using methods well known in the art such as, for example, hydrogenation or reduction with zinc dust or tin (II) chloride.

The aniline 10 can be converted to the oxamate 11 by reaction of 10 with diethyl oxalate at about 120°C for from about 5 to about 24 h, or with ethyl oxalyl chloride at about RT in a suitable anhydrous aprotic solvent such as, for example, DEE, dichloromethane, chloroform or THF.

The oxamate 11 may be converted to the oxamic acid 12 and the oxamide 13 using conventional methods well known in the relevant art. For example, the ester 11 may be hydrolyzed to the acid 12 using suitable aqueous alkalides such as, for example, alkali metal carbonates or hydroxides in an aqueous MeOH solution. The oxamide 13 can be synthesized by reacting the ester 11 with an amine in a suitable solvent such as, for example, dichloromethane, chloroform, THF or MeOH.

The acid 12 can be converted to salts 14 such as, for example, metal or ammonium salts by treatment of 12 with an equivalent amount of the corresponding base such as, for example, alkali or ammonium hydroxides, or by exchange with

001222222.030199

carboxylic acid salts or alkali siloxides, or, by ion exchange methods known in the art.

By SCHEME B:

- 5 The primary aniline 10 can be converted to the secondary aniline 16 according to methods well known in the art for conversion of a primary to a secondary amine such as, for example, by reductive alkylation. A preferred reductive alkylation method employs an aldehyde, or a ketone, and a reducing agent in a suitable solvent and is best performed in the presence of about 3Å molecular sieves. Preferred reducing agents are sodium cyanoborohydride, sodium triacetoxyborohydride and sodium borohydride. Preferred organic solvents are EtOH and
- 10 MeOH.

The resultant aniline 15 can be converted to the oxamate 16 and then the acid 17 by, e.g., methods analogous to those that have been previously described in SCHEME A discussed above.

By SCHEME C:

- 15 The nitro intermediate A can be converted to the aldehyde 18 by formylation. A preferred formylation method can be accomplished by reaction of A with hexamethylenetetramine at about 65°C in a suitable solvent such as, for example, TFA.

- 20 The aldehyde 18 can be oxidized to the carboxylic acid 19 by methods well known in the art, e.g., Jones oxidation. Preferred oxidation methods include Jones oxidation and those employing sodium hypochlorite. Reaction of the aldehyde 18 with Jones reagent (chromic acid/aqueous sulfuric acid) in acetone affords the carboxylic acid 19.

- 25 The nitro containing carboxylic acid compound 19 can be converted to the oxamate 20 in three steps (demethylation, nitro reduction and oxamate formation) by, e.g., procedures analogous to those described in SCHEME A provided hereinabove.

- 30 The oxamate 20 can be converted to the 3'-carboxamide derivative 21 according to methods known in the art. For example, employment of an acid chloride or anhydride (symmetrical or mixed) of 20 with an amine in a suitable dried aprotic solvent such as, for example, dichloromethane, THF, DME or DEE, in the presence of a base such as TEA, dimethylaminopyridine or pyridine, are two commonly used methods. Another method utilizes the reaction of 20 and the requisite amine in an

6012292.030199

aprotic solvent with any of the standard carbodiimide coupling reagents such as, for example, dicyclohexylcarbodiimide, 2-ethoxy-1-ethoxycarbonyl-1,2-dihydroquinoline and benzotriazol-1-yloxytris (dimethylamino)-phosphonium-hexafluorophosphate.

The ester 21 can be hydrolyzed to the oxamic acid 22 by, e.g., the procedure analogous to that described in SCHEME A discussed above.

By SCHEME D:

The amide 23 can be prepared by reaction of an acid chloride or anhydride (symmetrical or mixed) of 19 with a primary amine in a suitable solvent such as, for example, dichloromethane, THF, DME, DEE in the presence of a base such as, for example, TEA, DMAP or pyridine.

The amide 23 can be alkylated to the amide 24 by reaction of carboxamide anion of 23 with a suitable alkylation agent such as, for example, an alkyl halide. The carboxamide anion of 23 can be generated in DMF with a suitable base such as, for example, sodium hydride or potassium hydride. The alkylation of 23 can also be performed by phase transfer catalysis without solvent or with a suitable solvent such as, for example, DMF or DMSO. The phase transfer reaction uses tetrabutylammonium bromide ("TBAB") as the phase transfer agent and potassium carbonate, KOH or NaOH as the base.

The amide 24 can be converted to the corresponding compound 21, e.g., in three steps by procedures analogous to those described in SCHEME A discussed above.

By SCHEME E:

The compound B can be converted to the oxamate 25, e.g., in three steps by procedures analogous to those described in SCHEME A provided hereinabove.

Formylation of 25 can be accomplished by a formylation procedure analogous to that described in SCHEME C provided hereinabove.

The aldehyde 26 can be converted to the, e.g., methylamino, derivative 27 by methods known in the art. A preferred method utilizes reductive amination. For example, the reductive amination can be accomplished by the reaction of the aldehyde 26 with an amine and a reducing agent in a suitable solvent and is best performed in the presence of 3Å molecular sieves. Preferred reducing agents are

60122292-030199

sodium cyanoborohydride, sodium triacetoxymethylborohydride and sodium borohydride. Preferred organic solvents include EtOH, MeOH and 1,2-dichloroethane.

By SCHEME E:

- The oxamate 25 can be converted to the nitro compound 28 by nitration. The
- 5 nitro compound 28 can be reduced to the corresponding aniline 29 by, e.g., catalytic hydrogenation or chemical reduction with zinc dust or tin (II) chloride. Acylation of 29 with carbonyl chloride in the presence of a suitable base such as, for example, TEA or N,N-diisopropylethylamine, affords diacylated compound 30. The diacylated
- 10 oxamate 30 can be converted to the oxamic acid 32 by hydrolysis with a suitable base such as, for example, NaOH or KOH in an aqueous MeOH solution. Sulfonylation of 29 with sulfonyl chloride in the presence of a suitable base such as, for example, TEA or N,N-diisopropylethyl amine, yields disulfonylated compound 31. Hydrolysis of 31 with a suitable base such as, for example, NaOH or KOH, in an aqueous MeOH solution at about 50°C produces the oxamic acid 33.

15 By SCHEME G:

- The benzyl ether 37 can be converted to the phenol 38 by debenzoylation. Treatment of 37 with thioanisole in TFA at ambient temperature affords 38.
- Conversion of 38 to the phenyl ether 39 can be accomplished by coupling 38 with
- 20 arylfodionium tetrafluoroborate and copper bronze in the presence of triethyl amine in dichloromethane or coupling 38 with arylboronic acid and copper (II) acetate in the presence of a suitable base such as, for example, TEA, pyridine, or a mixture of TEA and pyridine. Conversion of 39 to the oxamate 40 can be accomplished, e.g., in three steps (demethylation, nitro reduction and oxamate formation) according to procedures analogous to those described in Scheme A discussed above. The oxamic
- 25 acid 41 is prepared by alkaline hydrolysis of ester 40.

By SCHEME H:

- Treatment of B with an arylsulfonic acid in the presence of Eaton's Reagent at elevated temperature provides a 3'-aryl sulfone 42. Demethylation of 42 followed by
- hydrogenation and then reaction with ethyl oxalyl chloride provides the oxamate 43.
- 30 The oxamate 43 may be hydrolysed to the oxamic acid 44 using a base, such as, for example, NaOH or KOH.

6012292.030199

By SCHEME I:

- The nitro compound B can be converted to the 3'-sulfinic acid 45 by treatment with chlorosulfonic acid followed by reduction with sodium sulfite in the presence of a base such as, for example, sodium bicarbonate or NaOH. Treatment of the sulfinic acid 45 with alkyl halide in the presence of a base such as, for example, NaOH, KOH, potassium t-butoxide, sodium hydride or sodium methoxide, provides the alkyl sulfone 46. The nitro compound 46 can be converted to the oxamate 47 via demethylation, hydrogenation and oxamate formation. Hydrolysis of the oxamate 47 under basic conditions provides the oxamic acid 48.

10 By SCHEME J:

- The methyl ether 18 can be converted to the phenol 49 using procedures analogous to those described in SCHEME A. The phenol 49 can be protected as the trimethylsilylethoxymethyl ether 50 by treatment with a strong base such as, for example, sodium hydride or potassium t-butoxide in an aprotic solvent, e.g., THF, followed by treatment with trimethylsilylethoxymethyl chloride ("SEMCL").

- 15 Treatment of the aldehyde 50 with a reducing agent such as, for example, diisobutylaluminum hydride ("DIBALH") in an aprotic solvent, e.g., dichloromethane or THF affords 51. Reaction of alcohol 51 with a suitable phenol utilizing an azodicarbonyl compound, e.g., 1,1'-(azodicarbonyl)dipiperidine or diethylazodicarboxylate and a phosphine such as, for example, triphenyl- or tributylphosphine in an aprotic solvent, e.g., THF or toluene, provides the ether 52.

- Removal of the "SEM" protecting group present in 52 under acidic conditions such as, for example, sulfuric or mineral acid in an alcoholic solvent, e.g., MeOH or EtOH, or alternatively, fluoride-mediated conditions (tetrabutylammonium fluoride/THF, hydrogen fluoride/acetonitrile) affords phenol 53. Reduction of the nitro group present in 53 by refluxing in acetic acid with a powdered metal, e.g., zinc or iron, provides the amine 54. Conversion to the oxamate 55 and the associated oxamic acids and oxamides is accomplished utilizing procedures analogous to those detailed in SCHEME A.

30 By SCHEME K:

Compounds 56-62 can be prepared according to procedures analogous to those described above in accordance with well known methods in the art. Those

601222219.030199

skilled in the art would understand from the present disclosure and, in particular, from SCHEME A, how to convert compound 62 to the oxamate derivatives detailed in SCHEME K. T completes, as discussed above where  $R^3$  and  $R^4$  are taken together, a carbocyclic ring A of the formula  $-(CH_2)_b-$  or a heterocyclic ring A selected from the group consisting of  $-Q-(CH_2)_c-$  and  $-(CH_2)_j-Q-(CH_2)_k-$  wherein b, Q, c, j and k are as described above, and wherein said carbocyclic ring A and said heterocyclic ring A are each independently optionally substituted with one or more substituents (e.g.,  $R^{21}$ ,  $R^{22}$ ) independently selected from  $C_{1-4}$  alkyl, halide or oxo, as also described above.

By SCHEME L:

Exhaustive treatment of 63 with a strong base such as, for example, lithium hexamethyldisilazane, lithium diisopropylamide or potassium t-butoxide and a suitable alkyl halide in an aprotic solvent, e.g., THF, affords the bis-alkylated intermediate 65. This process is carried out in a stepwise manner where  $R^{21}$  and  $R^{22}$  are different, and in a single reaction flask where  $R^{21}$  and  $R^{22}$  are the same.

One of the methyl ethers present in 65 can be selectively deprotected by utilizing boron trichloride or aluminum chloride in an aprotic solvent, e.g., dichloromethane or toluene.

Reduction of the ketone functionality present in 66 can be accomplished by treatment with a hydrosilane, preferably, triethylsilane, in the presence of an acid, e.g., methanesulfonic acid or TFA, with or without a solvent present. Solvents can be either protic or aprotic, with dichloromethane being preferred. Those skilled in the art will understand from the present disclosure how to convert the resultant reduced compounds to target oxamate derivatives.

T is as described for SCHEME K.

BY SCHEME M:

The indole 69 can be prepared by coupling the commercially available 5-hydroxy indole 67 with the 4-iodonitrobenzene 68 at about  $125^\circ\text{C}$  in the presence of potassium carbonate for about 3 h. The nitro compound 69 is converted to the target compound 70 via hydrogenation and oxamate formation.

In the preparation of the compounds of Formula I it is noted that, as would be appreciated by those skilled in the art, some of the methods useful for the preparation of such compounds, e.g., as exemplified by SCHEMES J and L discussed above,

60122292.030199

- may require protection of a particular functionality, e.g., to prevent interference by such functionality in reactions at other sites within the molecule or to preserve the integrity of such functionality. The need for, and type of, such protection is readily determined by one skilled in the art, and will vary depending on, for example, the nature of the functionality and the conditions of the selected preparation method. See, e.g., T.W. Greene, Protective Groups in Organic Synthesis, John Wiley & Sons, New York, 1991. Suitable protecting groups for any particular functionality would include those which are not substantially chemically reactive under the reaction conditions described and which can be removed without substantially chemically altering other functionalities of any given intermediate of the compound of Formula I, or of the compound of Formula I itself. The protecting group can be removed as so desired in any given preparation method, e.g., in a subsequent step.

- Some of the Formula I compounds of this invention are acidic and they form a salt with a pharmaceutically acceptable cation. Some of the Formula I compounds of this invention are basic and they form a salt with a pharmaceutically acceptable anion. All such salts are within the scope of this invention and they can be prepared by conventional methods such as combining the acidic and basic entities, usually in a stoichiometric ratio, in either an aqueous, non-aqueous or partially aqueous medium, as appropriate. The salts are recovered either by filtration, by precipitation with a non-solvent followed by filtration, by evaporation of the solvent, or, in the case of aqueous solutions, by lyophilization, as appropriate. The compounds can be obtained in crystalline form by dissolution in an appropriate solvent(s) such as ethanol, hexanes or water/ethanol mixtures.

- Suitable lipase inhibitors can be prepared using methods known to those skilled in the art, for example, tetrahydrolipstatin ((2S,3S,5S)-5-[(S)-2-formamido-4-methyl-valeryl-oxy]-2-hexyl-3-hydroxy-hexadecanoic 1,3 acid lactone) can be prepared as described in, e.g., U.S. Patent Nos. 5,274,143; 5,420,305; 5,540,917; and 5,643,874.

- The administration of a compound, prodrug, isomer or pharmaceutically acceptable salt of the present invention and an anorectic agent or a lipase inhibitor, as the case may be, according to this invention can be sequential in time or simultaneous with the simultaneous method being generally preferred. For sequential administration, a compound, a prodrug, an isomer or a pharmaceutically acceptable salt of the present invention and an anorectic agent or a lipase inhibitor, as the case may be, can be administered in any order. In addition, for sequential administration, the compound, prodrug, isomer or pharmaceutically acceptable salt of the present invention and the anorectic agent (or the lipase inhibitor as the case may be), can be administered in any order. It is generally preferred that such administration be oral. It is even more preferred that the administration be oral and simultaneous. However, for example, if the subject being treated is unable to swallow, or oral absorption is otherwise impaired or undesirable, parenteral or transdermal administration will be appropriate. Where the administration is sequential, the administration of a compound, prodrug, isomer or pharmaceutically acceptable salt of the present invention and an anorectic agent or a lipase inhibitor, as the case may be, can be by the same method or by different methods.

60122292.030199

6012222-030199

The dose of a compound, prodrug, isomer or pharmaceutically acceptable salt of this invention to be administered to a human or animal is rather widely variable and subject to the judgment of the attending physician or veterinarian. As would be understood by those skilled in the art, it may be necessary to adjust the dose of a compound, prodrug or isomer of this invention when it is administered in the form of a salt, e.g., where the salt forming moiety of which has an appreciable molecular weight. The general range of effective administration rates of the compounds, prodrugs, isomers or pharmaceutically acceptable salts of this invention is from about 0.001 mg/kg body weight to about 100 mg/kg body weight of the subject per day. A preferred range of effective administration rates of the compounds, prodrugs, isomers or pharmaceutically acceptable salts of this invention is from about 0.01 mg/kg body weight to about 50 mg/kg body weight of the subject per day. While it may be practical to administer the daily dose of a compound, prodrug, isomer or pharmaceutically acceptable salt of this invention, in portions, at various hours of the day, in any given case, the amount of compound, prodrug, isomer or pharmaceutically acceptable salt administered will depend on such factors as the solubility of the compound, prodrug, isomer or pharmaceutically acceptable salt of this invention, the formulation used and the route of administration (e.g., orally, transdermally, parenterally or topically).

Dosages of the compounds, prodrugs, isomers and pharmaceutically acceptable salts of the present invention can be administered to humans by any suitable route, with oral administration being preferable. Individual tablets or capsules should generally contain from about 0.1 mg to about 100 mg of compound, prodrug, isomer or pharmaceutically acceptable salt of this invention, in a suitable pharmaceutically acceptable vehicle, diluent or carrier. Dosages for intravenous administration are generally within the range of from about 0.1 mg to about 10 mg per single dose as required. For intranasal or inhaler administration, the dosage is generally formulated as from about a 0.1 % to about a 1 % (w/v) solution. In practice, the physician will determine the actual dosage which will be most suitable for an individual patient and it will vary with, e.g., age, weight and response of the particular patient. The above dosages are exemplary of the average case but there can, of course, be individual instances where higher or lower dosage ranges are merited.

and all such dosages of compounds, prodrugs, isomers and pharmaceutically acceptable salts of this invention, are within the scope of the present invention.

- Any suitable dosage of an anorectic agent can be used in aspects of the present invention comprising such agents. The dosage of the anorectic agent is generally in the range of from about 0.01 to about 50 mg/kg body weight of the subject per day, preferably from about 0.1 to about 10 mg/kg body weight of the subject per day, administered singly or as a divided dose. For example, where the anorectic agent is phentermine, the dosage of phentermine is from about 0.01 to 50 mg/kg body weight of the subject per day, preferably from about 0.1 to about 1 mg/kg body weight of the subject per day. In addition, where the anorectic agent is sibutramine, the dosage range is from about 0.01 to about 50 mg/kg body weight of the subject per day, preferably from about 0.1 to about 1 mg/kg body weight of the subject per day; where the anorectic agent is dexfenfluramine or fenfluramine, the dosage range is from about 0.01 to about 50 mg/kg body weight of the subject per day; and where the anorectic agent is bromocriptine, the dosage range is from about 0.01 to about 10 mg/kg body weight of the subject per day, preferably from about 0.1 to about 10 mg/kg body weight of the subject per day. In practice, the physician will determine the actual dosage of anorectic agent which will be most suitable for an individual patient and it will vary with, e.g., age, weight and response of the particular patient. The above dosages of anorectic agents are exemplary but there can, of course, be individual instances where higher or lower dosage ranges of such anorectic agents are merited, and all such dosages are within the scope of the present invention.
- Any suitable dosage of a lipase inhibitor can be used in aspects of the present invention comprising such inhibitors. The dosage of the lipase inhibitor is generally in the range of from about 0.01 to about 50 mg/kg body weight of the subject per day, preferably from about 0.05 to about 10 mg/kg body weight of the subject per day, administered singly or as a divided dose. For example, where the lipase inhibitor is tetrahydrolipstatin, the dosage of tetrahydrolipstatin is preferably from about 0.05 to 2 mg/kg body weight of the subject per day. In practice, the physician will determine the actual dosage of lipase inhibitor which will be most suitable for an individual

60122292.030196

patient and it will vary with, e.g., age, weight and response of the particular patient. The above dosages of lipase inhibitors are exemplary but there can, of course, be individual instances where higher or lower dosage ranges of such lipase inhibitors are merited, and all such dosages are within the scope of the present invention.

- 5 Any suitable route of administration may be used in the present invention. It is usually preferred to administer the compounds, prodrugs, isomers and pharmaceutically acceptable salts of this invention orally for reasons of convenience; however, they may be administered, for example, percutaneously, or as suppositories for absorption by the rectum, as desired in a given instance. As described above, the
- 10 administration may be carried out in single or multiple doses, as appropriate.

- The compounds, prodrugs, isomers and pharmaceutically acceptable salts of this invention may be administered alone, and are preferably administered as pharmaceutical compositions comprising a pharmaceutically acceptable vehicle, carrier or diluent. The pharmaceutical compositions of the invention will comprise a
- 15 suitable amount of a compound, prodrug, isomer or pharmaceutically acceptable salt of this invention, i.e., an amount sufficient to provide the desired dosage.

- The compounds, prodrugs, isomers and pharmaceutically acceptable salts of this invention can be administered in a wide variety of different dosage forms, i.e., they may be combined with various pharmaceutically acceptable inert carriers in any
- 20 suitable form. Such carriers include solid diluents or fillers, sterile aqueous media and various non-toxic organic solvents. The pharmaceutical compositions can be formulated to contain a daily dose, or a convenient fraction of a daily dose, in a dosage unit, which may be a single tablet or a capsule or a convenient volume of a liquid.

- 25 All of the usual types of pharmaceutical compositions may be used in the present invention, including tablets, lozenges, hard candies, chewable tablets, granules, powders, sprays, capsules, pills, microcapsules, solutions, parenteral solutions, troches, injections (e.g., intravenous, intraperitoneal, intramuscular or subcutaneous), suppositories, elixirs, syrups and suspensions.

- 30 For parenteral administration, the compounds, prodrugs, isomers and pharmaceutically acceptable salts of this invention may be used as solutions in sesame or peanut oil, or as aqueous solutions (e.g., aqueous propyleneglycol), as

6012229.030199

the case may be, and they are best used in the form of a sterile aqueous solution which may contain other substances; for example, enough salts or glucose to make the solution isotonic, the pH of the solution being suitably adjusted and buffered, where necessary, and surfactants such as, for example, hydroxypropylcellulose.

- 5 Such oily solutions are suitable for intra-articular, intramuscular and subcutaneous injection purposes. Such aqueous solutions are suitable for intravenous injection purposes.

The compounds, prodrugs, isomers and pharmaceutically acceptable salts of this invention may also be administered topically and this may be done by way of,  
10 e.g., creams, jellies, salves, lotions, gels, pastes, ointments, and the like, in accordance with standard pharmaceutical practice. The compounds, prodrugs, isomers and pharmaceutically acceptable salts of this invention of the present invention may also be administered transdermally (e.g., through the use of a patch).

Any suitable formulation for transdermal application comprising a compound  
15 of the present invention may be employed and such formulations would generally also contain a suitable transdermal carrier, e.g., an absorbable pharmacologically acceptable solvent to promote and assist passage of the compounds through the subject's skin. For example, suitable transdermal devices may comprise the form of a bandage having a backing member and a reservoir containing the subject  
20 compound. Such bandage-type transdermal devices may further include suitable carriers, rate-controlling barriers, and means for securing the transdermal device to the subject's skin.

As will be described in detail hereinbelow, the pharmaceutical compositions can be prepared by methods commonly employed using conventional, organic or  
25 inorganic additives, such as an excipient (e.g., sucrose, starch, mannitol, sorbitol, lactose, glucose, cellulose, talc, calcium phosphate or calcium carbonate), a binder (e.g., cellulose, methylcellulose, hydroxymethylcellulose, polypropylpyrrolidone, polyvinylpyrrolidone, gelatin, gum arabic, polyethyleneglycol, sucrose or starch), a disintegrator (e.g., starch, carboxymethylcellulose, hydroxypropylstarch, low  
30 substituted hydroxypropylcellulose, sodium bicarbonate, calcium phosphate, or calcium citrate), a lubricant (e.g., magnesium stearate, light anhydrous silicic acid, talc or sodium lauryl sulfate), a flavoring agent (e.g., citric acid, menthol, glycine or

60122292.030199

orange powder), a preservative (e.g., sodium benzoate, sodium bisulfite, methylparaben or propylparaben), a stabilizer (e.g., citric acid, sodium citrate or acetic acid), a suspending agent (e.g., methylcellulose, polyvinylpyrrolidone, or aluminum stearate), a dispersing agent (e.g., hydroxypropylmethylcellulose), a diluent (e.g., water), a coloring agent, an emulsifying agent, and a base wax (e.g., cocoa butter, white petrolatum or polyethylene glycol).

Any of the compounds, prodrugs, isomers or pharmaceutically acceptable salts of this invention may be readily formulated as tablets, capsules, and the like. It is preferable to prepare solutions from water-soluble salts, such as the hydrochloride salt.

In general, all of the pharmaceutical compositions are prepared according to methods usual in pharmaceutical chemistry.

Capsules can be prepared by mixing a compound, prodrug, isomer or pharmaceutically acceptable salt of the invention with a suitable diluent and filling the proper amount of the mixture in capsules. The usual diluents include inert powdered substances such as starch of many different kinds, powdered cellulose, especially crystalline and microcrystalline cellulose, sugars such as fructose, mannitol and sucrose, grain flours and similar edible powders.

Tablets can be prepared by direct compression, by wet granulation, or by dry granulation. Their formulations usually incorporate diluents, binders, lubricants and disintegrators as well as a compound, prodrug, isomer or pharmaceutically acceptable salt of this invention. Common diluents include, for example, various types of starch, lactose, mannitol, kaolin, calcium phosphate or sulfate, inorganic salts such as sodium chloride and powdered sugar. Powdered cellulose derivatives may also be used. Common tablet binders include substances such as starch, gelatin and sugars such as lactose, fructose, glucose and the like. Natural and synthetic gums are also convenient, including acacia, alginates, methylcellulose, polyvinylpyrrolidone and the like. Polyethylene glycol, ethylcellulose and waxes can also serve as binders.

A lubricant is generally necessary in a tablet formulation to prevent the tablet and punches from sticking in the die. The lubricant is chosen from such slippery

50122292.030199

solids as talc, magnesium and calcium stearate, stearic acid and hydrogenated vegetable oils.

Tablet disintegrators include substances which swell when wetted to break up the tablet and release a compound, prodrug, isomer or pharmaceutically acceptable salt of this invention. They include starches, clays, celluloses, algin and gums. More particularly, corn and potato starches, methylcellulose, agar, bentonite, wood cellulose, powdered natural sponge, cation-exchange resins, alginic acid, guar gum, citrus pulp and carboxymethylcellulose, for example, may be used as well as sodium lauryl sulfate.

Tablets are often coated with sugar as a flavor and sealant, or with film-forming protecting agents to modify the dissolution properties of the tablet. The compounds, prodrugs, isomers and pharmaceutically acceptable salts of this invention may also be formulated as chewable tablets, by using large amounts of pleasant-tasting substances such as mannitol in the formulation, as is now well-established in the art.

Where it is desired to administer a compound, prodrug, isomer or pharmaceutically acceptable salt of this invention as a suppository, any suitable base can be used. Cocoa butter is a traditional suppository base, which may be modified by the addition of waxes to raise its melting point. Water-miscible suppository bases comprising, particularly, polyethylene glycols of various molecular weights are in wide use.

As discussed above, the effect of a compound, prodrug, isomer or pharmaceutically acceptable salt of this invention may be delayed or prolonged by proper formulation. For example, a slowly soluble pellet of a compound, prodrug, isomer or pharmaceutically acceptable salt of this invention may be prepared and incorporated in a tablet or capsule. The technique may be improved by making pellets of several different dissolution rates and filling capsules with a mixture of the pellets. Tablets or capsules may be coated with a film which resists dissolution for a predictable period of time. The parenteral preparations may also be made long-acting by dissolving or suspending a compound, prodrug, isomer or pharmaceutically acceptable salt of this invention, as the case may be, in oily or emulsified vehicles which allow it to disperse only slowly in the serum.

60122292.030199

The compounds, prodrugs, isomers and pharmaceutically acceptable salts of this invention may also be administered to a mammal other than a human. The method of administration and the dosage to be administered to such a mammal will depend, for example, on the animal species and the disease or disorder being treated. The compounds, prodrugs, isomers and pharmaceutically acceptable salts of this invention may be administered to animals in any suitable manner, e.g., orally, parenterally or transdermally, in any suitable form such as, for example, a capsule, bolus, tablet, pellet, e.g., prepared by admixing a compound, prodrug, isomer or pharmaceutically acceptable salt of this invention with a suitable diluent such as carbowax or carnuba wax together with a lubricant, liquid drench or paste, e.g., prepared by dispersing a compound, prodrug, isomer or pharmaceutically acceptable salt of this invention in a pharmaceutically acceptable oil such as peanut oil, sesame oil or corn oil. The compounds, prodrugs, isomers and pharmaceutically acceptable salts of this invention may also be administered to animals as an implant. Such formulations are prepared in a conventional manner in accordance with standard veterinary practice. As an alternative, the compounds, prodrugs, isomers and pharmaceutically acceptable salts of this invention may be administered with the water supply, e.g., in the form of a liquid or water-soluble concentrate. In addition, the compounds, prodrugs, isomers and pharmaceutically acceptable salts of this invention, e.g., within the pharmaceutical compositions of the invention, may be administered in the animal feedstuff, e.g., a concentrated feed additive or premix may be prepared for mixing with the normal animal feed, commonly along with a suitable carrier therefor. The carrier facilitates uniform distribution of a compound, prodrug, isomer or pharmaceutically acceptable salt of this invention in the, e.g., finished feed with which the premix is blended. Suitable carriers include, but are not limited to, liquids, e.g., water, oils such as soybean, corn, cottonseed, or volatile organic solvents, and solids, e.g., a small portion of the feed or various suitable meals including alfalfa, soybean, cottonseed oil, linseed oil, comcob, corn, molasses, urea and bone, and mineral mixes.

Since the present invention has an aspect that relates to the treatment of the disease/conditions described herein with a combination of active ingredients which may be administered separately, the invention also relates to combining separate

- pharmaceutical compositions in kit form. The kit comprises two separate pharmaceutical compositions: a compound of Formula I, or a prodrug thereof, or a geometric or optical isomer thereof, or a pharmaceutically acceptable salt of such compound, prodrug, or isomer, and a second compound as described above. The kit
- 5 comprises a container for containing the separate compositions such as a divided bottle or a divided foil packet. Typically the kit comprises directions for the administration of the separate components. The kit form is particularly advantageous when the separate components are preferably administered in different dosage forms (e.g., oral and parenteral), are administered at different dosage intervals, or when
- 10 titration of the individual components of the combination is desired by the prescribing physician.

- An example of such a kit is a so-called blister pack. Blister packs are well known in the packaging industry and are being widely used for the packaging of pharmaceutical unit dosage forms (tablets, capsules, and the like). Blister packs
- 15 generally consist of a sheet of relatively stiff material covered with a foil of a preferably transparent plastic material. During the packaging process, recesses are formed in the plastic foil. The recesses have the size and shape of the tablets or capsules to be packed. Next, the tablets or capsules are placed in the recesses and the sheet of relatively stiff material is sealed against the plastic foil at the face of the
- 20 foil which is opposite from the direction in which the recesses were formed. As a result, the tablets or capsules are sealed in the recesses between the plastic foil and the sheet. Preferably the strength of the sheet is such that the tablets or capsules can be removed from the blister pack by manually applying pressure on the recesses whereby an opening is formed in the sheet at the place of the recess. The tablet or
- 25 capsule can then be removed via said opening.

- It may be desirable to provide a memory aid on the kit, e.g., in the form of numbers next to the tablets or capsules whereby the numbers correspond with the days of the regimen which the tablets or capsules so specified should be ingested. Another example of such a memory aid is a calendar printed on the card, e.g., as
- 30 follows "First Week, Monday, Tuesday, ...etc.... Second Week, Monday, Tuesday,..." etc. Other variations of memory aids will be readily apparent. A "daily dose" can be a single tablet or capsule or several tablets or capsules to be taken on a given day.

60122297.030499

Also, a daily dose of a compound of Formula I, or a prodrug thereof, or a geometric or optical isomer thereof, or a pharmaceutically acceptable salt of such compound, prodrug or isomer, can consist of one tablet or capsule while a daily dose of the second compound can consist of several tablets or capsules and vice versa. The memory aid should reflect this.

In another specific embodiment of the invention, a dispenser designed to dispense the daily doses one at a time in the order of their intended use is provided. Preferably, the dispenser is equipped with a memory-aid, so as to further facilitate compliance with the regimen. An example of such a memory-aid is a mechanical counter which indicates the number of daily doses that has been dispensed. Another example of such a memory-aid is a battery-powered micro-chip memory coupled with a liquid crystal readout, or audible reminder signal which, for example, reads out the date that the last daily dose has been taken and/or reminds one when the next dose is to be taken.

Utility of the compounds of Formula I, or the isomers thereof, or the pharmaceutically acceptable salts of such compounds, or isomers thereof, can be evidenced by activity in at least one of the two assays described below.

#### ASSAY 1

##### Oxygen Consumption

As would be appreciated by those skilled in the relevant art, during increased energy expenditure, animals generally consume more oxygen. In addition, metabolic fuels such as, for example, glucose and fatty acids, are oxidized to  $\text{CO}_2$  and  $\text{H}_2\text{O}$  with the concomitant evolution of heat, commonly referred to in the art as thermogenesis. Thus, the measurement of oxygen consumption in animals, including humans and companion animals, is an indirect measure of thermogenesis. Indirect calorimetry is commonly used in animals, e.g., humans, by those skilled in the relevant art to measure such energy expenditures.

Those skilled in the art understand that increased energy expenditure and the concomitant burning of metabolic fuels resulting in the production of heat may be efficacious with respect to the treatment of, e.g., obesity. As is well known by those skilled in the art, thyroid hormones affect cardiac functioning, for example, by causing

6012222.030109

an increase in the heart rate and, accordingly, an increase in oxygen consumption with concomitant heat production.

- The ability of the compounds, isomers thereof, and pharmaceutically acceptable salts of said compounds and isomers of this invention to generate a thermogenic response may be demonstrated according to the following protocol.

A. Experimental.

- This *in vivo* screen is designed to evaluate the efficacy and cardiac effects of compounds that are tissue-selective thyroid hormone agonists. The efficacy endpoints measured are whole body oxygen consumption and the activity of liver mitochondrial alpha-glycerophosphate dehydrogenase ("mGPDH"). The cardiac endpoints that are measured are heart weight and heart mGPDH activity. The protocol involves: (a) dosing fatty Zucker rats for about 6 days, (b) measuring oxygen consumption and (c) harvesting tissue for preparation of mitochondria and subsequent assaying of enzyme activity thereby.

B. Preparation of Rats.

Male fatty Zucker rats having a body weight range of from about 400 g to about 500 g are housed for from about 3 to about 7 days in individual cages under standard laboratory conditions prior to the initiation of the study.

- A compound of Formula I, or an isomer thereof, or a pharmaceutically acceptable salt of such compound or isomer, vehicle or T<sub>3</sub> sodium salt, is administered by oral gavage as a single daily dose given between about 3 p.m. to about 6 p.m. for about 6 days. A compound of Formula I, or an isomer thereof, or a pharmaceutically acceptable salt of such compound or isomer, or T<sub>3</sub> sodium salt is dissolved in a suitably small volume of about 1N NaOH and then brought up to a suitable volume with about 0.01N NaOH containing about 0.25 % of methyl cellulose (10:1, 0.01N NaOH/MC:1N NaOH). The dosing volume is about 1 ml.

C. Oxygen Consumption.

- About 1 day after the last dose of the compound is administered, oxygen consumption is measured using an open circuit, indirect calorimeter (Oxymax, Columbus Instruments, Columbus, OH 43204). The Oxymax gas sensors are calibrated with N<sub>2</sub> gas and a gas mixture (about 0.5 % of CO<sub>2</sub>, about 20.5 % of O<sub>2</sub>, about 79 % of N<sub>2</sub>) before each experiment.

50122292.030199

The subject rats are removed from their home cages and their body weights recorded. The rats are placed into the sealed chambers (43 x 43 x 10 cm) of the Oxyman, the chambers are placed in the activity monitors, and the air flow rate through the chambers is then set at from about 1.6 L/min to about 1.7 L/min.

5 The Oxyman software then calculates the oxygen consumption (mL/kg/h) by the rats based on the flow rate of air through the chambers and the difference in oxygen content at the inlet and output ports. The activity monitors have 15 infrared light beams spaced about one inch apart on each axis, and ambulatory activity is recorded when two consecutive beams are broken, and the results are recorded as  
10 counts.

Oxygen consumption and ambulatory activity are measured about every 10 min for from about 5 h to about 6.5 h. Resting oxygen consumption is calculated on individual rats by averaging the values excluding the first 5 values and the values obtained during time periods where ambulatory activity exceeds about 100 counts.

#### ASSAY 2

##### Binding to Thyroid Hormone Receptors

The ability of a compound of Formula I, or an isomer thereof, or a pharmaceutically acceptable salt of such compound or isomer, ("the test thyromimetic compounds"), to bind to thyroid hormone receptors can be demonstrated in the  
20 following protocol.

##### A. Preparation of Insect Cell Nuclear Extracts

High Five cell pellets (BTI-TN-5B1-4, catalogue number B855-02, Invitrogen<sup>®</sup>,  
25 Carlsbad, California) obtained about 48 h after infection with baculovirus (GibcoBRL<sup>®</sup>, Gaithersburg, Maryland) expressing either human TR $\alpha$  or TR $\beta$  were suspended in ice cold Sample Buffer (10 mM Tris, pH 8.0; 1 mM MgCl<sub>2</sub>; 1 mM DTT; 0.05 % Tween 20; 1 mM 4-(2-aminoethyl)-benzenesulfonylfluoride; 25  $\mu$ g/mL leupeptin). After about 10 min incubation on ice, the suspension was homogenized by 20 strokes with a Dounce  
30 homogenizer (VWR<sup>®</sup> Scientific Products, West Chester, Pennsylvania) and centrifuged at 800xg for about 15 min at 4°C. The pellet (nuclei) was suspended in a hypertonic buffer (0.4 M KCl; 10 mM Tris, pH 8.0; 1mM MgCl<sub>2</sub>; 1 mM DTT; 0.05% Tween 20) and incubated for about 30 min on ice. The suspension was centrifuged at

6012292.030199

100,000xg for about 30 min at 4°C. The supernatant (nuclear extract) was stored in 0.5 mL aliquots at -80°C.

#### B. Binding Assay

- Competition binding assays to measure the interaction of the test  
5 thyromimetic compounds with thyroid hormone receptor  $\alpha 1$  and  $\beta 1$  (TR $\alpha$  and TR $\beta$ ) are carried out according to the following protocol.

- Solutions of test thyromimetic compounds (final compound concentration of 20 mM) are prepared using 100 % DMSO as a solvent. Each compound is serially diluted in an assay buffer (5 mM Tris-HCl, pH 8.0; 50 mM NaCl; 2 mM EDTA; 10 %  
10 (v/v) glycerol; 1 mM DTT, "assay buffer") containing 0.4 nM  $^{125}\text{I}$ -T<sub>3</sub> (specific activity of about 220 Ci/mmol) to yield solutions that varied in compound concentration from about 10  $\mu\text{M}$  to about 0.1 nM.

High Five insect cell nuclear extract containing either TR $\alpha$  or TR $\beta$  is diluted to a total protein concentration of 0.0075 mg/mL using the assay buffer as diluent.

- 15 One volume (100  $\mu\text{L}$ ) of each thyromimetic compound dilution (containing 0.4 nM  $^{125}\text{I}$ -T<sub>3</sub>) is combined with an equal volume (100  $\mu\text{L}$ ) of diluted nuclear extract containing TR $\alpha 1$  or TR $\beta 1$ , and incubated at RT for about 90 min. 150  $\mu\text{L}$  sample of the binding reaction is removed and placed into a 96-well filter plate (Millipore<sup>®</sup>, Bedford, Massachusetts) that had been pre-washed with ice-cold assay buffer. The  
20 plate is subjected to vacuum filtration using a filtration manifold (Millipore<sup>®</sup>). Each well is washed five times by the addition of 200  $\mu\text{L}$  of ice-cold assay buffer and subsequent vacuum filtration. The plate is removed from the vacuum filtration manifold, the bottom of the plate is briefly dried on paper towels, then 25  $\mu\text{L}$  of  
25 Wallac<sup>®</sup> (EG&G Wallac<sup>®</sup>, Gaithersburg, Maryland) Optiphase Supermix scintillation cocktail is added to each well and the top of the plate is covered with plastic sealing tape (Microplate Press-on Adhesive Sealing Film, Packard<sup>®</sup> Instrument Co., Inc., Downers Grove, Illinois) and the radioactivity is quantitated using a Wallac<sup>®</sup> Microbeta 96-Well plate scintillation counter.

- The following EXAMPLES are provided solely for the purposes of illustration  
30 and do not limit the invention which is defined by the claims.

EXAMPLE 2

30 N-[3,5-Dichloro-4-[3-(3,3-dimethyl-piperidine-1-carbonyl)-4-hydroxy-phenoxy]-phenyl]-oxamic acid ethyl ester

Step A

A mixture of 2',6'-dichloro-4-methoxy-4'-nitrodiphenyl ether (5.0 g, 16 mmol), TFA (50 mL) and hexamethylenetetramine (3.35 g, 24 mmol) was stirred at 70°C for 3 h to give a yellow solution. TFA was removed by rotavap to give a viscous yellow oil

661060.2622109

which was diluted with H<sub>2</sub>O (100 mL) and stirred at RT for 0.5 h. Saturated aqueous NaHCO<sub>3</sub> (300 mL) was added and the mixture was extracted with EtOAc (3 x 100 mL). The combined organic extracts are washed with brine (200 mL), dried and concentrated to give a yellow solid. MS Calc.: 341.0 Found: 340.4 (M-1).

Step B

To a solution of 5-(2,6-dichloro-4-nitro-phenoxy)-2-methoxy-benzaldehyde (1.0 g, 2.9 mmol) in acetone (30 mL) was added slowly Jones reagent (3.0 mL). The resulting solution was stirred at RT for 1 h and quenched with isopropanol (4 mL). The solid was removed by filtration through Celite®. The bluish solution was concentrated to give yellow solid with blue supernatant. The solid was dissolved in EtOAc and dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and concentrated. The resulting yellow oily solid was partially dissolved in EtOAc (25 mL) and extracted with saturated aqueous NaHCO<sub>3</sub> (5 x 75 mL). The combined aqueous extracts were acidified with 2N HCl, extracted with EtOAc (4 x 100 mL), dried and concentrated to give a yellow solid. MS Calc.: 356.9 Found: 357.8 (M-1).

Step C

To a solution of 5-(2,6-dichloro-4-nitro-phenoxy)-2-methoxy-benzoic acid (0.81 g, 2.3 mmol) in chloroform (20 mL) at RT was added dropwise tribromide (1 N in CH<sub>2</sub>Cl<sub>2</sub>, 4.5 mL, 4.5 mmol). The resulting mixture was stirred at RT for 1 h and quenched with H<sub>2</sub>O (20 mL). After stirring at RT for 0.5 h, the aqueous phase was basified with saturated aqueous NaHCO<sub>3</sub> (30 mL). The organic phase was extracted with saturated aqueous NaHCO<sub>3</sub> (4 x 50 mL). The combined aqueous extracts were acidified with concentrated HCl to give a white precipitate which was extracted with EtOAc (4 x 100 mL). The combined organic extracts were dried and concentrated to give a yellow-white solid. MS Calc.: 342.9 Found: 341.8 (M-1).

Step D

To a solution of 5-(2,6-dichloro-4-nitro-phenoxy)-2-hydroxybenzoic acid (0.69 g, 2 mmol) in a mixture of EtOAc (4 mL) and MeOH (12 mL) was added 10% Pd/C (70 mg). The solution was hydrogenated under 40 psi of pressure at RT for 2 h then filtered through Celite®. The filtrate was concentrated. The product was used in the next step without further purification. MS Calc.: 312.9 Found: 311.9 (M-1).

Step E

- 5 A mixture of 5-(2,6-dichloro-4-amino-phenoxy)-2-hydroxybenzoic acid (0.63 g, 2 mmol) and diethyl oxalate (4.4 g, 30 mmol) was stirred at 140°C for 3 h. The excess diethyl oxalate was removed under vacuum to give a brown oily solid which was triturated with hexanes to remove the remaining diethyl oxalate. The tan solid was collected by filtration and washed with CH<sub>2</sub>Cl<sub>2</sub>/hexanes (5% CH<sub>2</sub>Cl<sub>2</sub> in hexanes). The product was used in the next step without further purification. MS Calc.: 413.0 Found: 411.8 (M-1).

Step F

- 10 To a solution of 5-[2,6-dichloro-4-(ethoxyoxalyl-amino)-phenoxy]-2-hydroxybenzoic acid (29 mg, 0.07 mmol) in THF at RT was added thionyl chloride (25 mg, 0.21 mmol). The resulting mixture was stirred at 60°C for 1 h and concentrated in vacuum to give the acid chloride as a tan solid. The acid chloride was dissolved in chloroform (0.5 mL) and to which was added diisopropylethylamine (18 mg, about 0.14 mmol) and 3,3-dimethylpiperidine (9.4 mg, 0.083 mmol). The resulting mixture was stirred at RT for 17 h and concentrated. The crude product was purified by preparative TLC (6% acetone in CH<sub>2</sub>Cl<sub>2</sub>) to give the title compound as a white solid. MS Calc.: 509.4 Found: 507.2 (M-1).

20

Step A

To a solution of 2',6'-dichloro-4-methoxy-4'-nitrodiphenyl ether (10g, 31.8 mmol) in chloroform (200 mL) at 0°C was added dropwise borontribromide (1N in CH<sub>2</sub>Cl<sub>2</sub>, 63.7 mL, 63.7 mmol). After stirring at RT for 3 h, the reaction was quenched  
25 with H<sub>2</sub>O (200 mL). The mixture was stirred at RT for 1 h, and the phases were separated. The aqueous phase was extracted with chloroform (2 x 150 mL). The combined organic phases were washed with H<sub>2</sub>O (1 x 200 mL), saturated aqueous NaHCO<sub>3</sub> (1 x 200 mL), brine (1 x 200 mL), dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and concentrated to afford a brown solid. The crude product was used in the next step  
30 without further purification. NMR (400 MHz, CD<sub>3</sub>OD) δ 8.28 (s, 2H), 6.67-6.70 (m, 2H), 6.61-6.64 (m, 2H). MS Calc.: 299.0, Found: 298.2 (M-1).

60122292.030159

Step B

To a solution of 2',6'-dichloro-4-hydroxy-4'-nitrodiphenyl ether (9.5 g, 32 mmol) in a mixture of EtOAc (50 mL) and MeOH (150 mL) was added 0.48 g of 10% Pd/C. The mixture was hydrogenated under 40 psi of pressure at RT for 5 h. The solution was filtered through Celite® and concentrated to give a brown solid. NMR (400 MHz, CD<sub>3</sub>OD) δ 6.71 (s, 2H), 6.66-6.68 (m, 2H), 6.59-6.61 (m, 2H). MS Calc.: 269.0, Found: 268.2 (M-1).

Step C

A mixture of 2',6'-dichloro-4-hydroxy-4'-aminodiphenyl ether (8.6 g, 31.8 mmol) and diethyl oxalate (69.8 g, 47.8 mmol) was stirred at 140°C for 2 h to give a brown solution. The excess diethyl oxalate was removed under reduced pressure and the resulting oily brown solid was triturated with a mixture of CH<sub>2</sub>Cl<sub>2</sub>/hexane (1/9, 200 mL) for 1 h. The solid was collected by filtration, washed with CH<sub>2</sub>Cl<sub>2</sub>/hexane and dried under vacuum to give a tan solid. The product was used in the next step without further purification. NMR (400 MHz, CDCl<sub>3</sub>) δ 7.68 (s, 2H), 6.59-6.61 (m, 2H), 6.53-6.55 (m, 2H), 4.25-4.30 (q, 2H), 1.27-1.31 (t, 3H). MS Calc.: 369.0, Found: 367.5 (M-1).

Step D

A mixture of N-[3,5-dichloro-4-(4-hydroxy-phenoxy)-phenyl]-oxamic acid ethyl ester (500 mg, 1.35 mmol), TFA (5.0 mL) and hexamethylenetetramine (284 mg, 2.03 mmol) was stirred at 75°C for 1 h to give a red-brown solution. The solution was cooled to RT. TFA was removed under reduced pressure and 20 mL of H<sub>2</sub>O was added to the remaining brown oil. After stirring for 20 min at RT, the mixture was extracted with EtOAc (2 x 20 mL). The aqueous phase was basified with saturated aqueous NaHCO<sub>3</sub> and extracted with an additional EtOAc (2 x 20 mL). The combined EtOAc extracts were washed with saturated aqueous NaHCO<sub>3</sub> (2 x 30 mL), H<sub>2</sub>O (50 mL), 1 N HCl (2 x 50 mL), brine (50 mL), dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and concentrated to give a brown solid. The crude product was purified by flash column chromatography to afford a white solid. NMR (400 MHz, CDCl<sub>3</sub>) δ 10.72 (s, 1H), 9.77 (s, 1H), 8.90 (s, 1H), 7.71 (s, 2H), 7.14-7.17 (dd, 1H), 6.96-6.98 (d, 1H), 6.89-6.90 (d, 1H), 4.42-4.47 (q, 2H), 1.23-1.27 (t, 3H). MS Calc.: 397.0, Found: 395.7 (M-1).

60122222.030199

Step E

After stirring at RT for 3 h, the solution became clear and yellow. The solution was quenched with saturated aqueous NaHCO<sub>3</sub> (5 mL) and extracted with Et<sub>2</sub>O (3 x 10 mL). The combined extracts were dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and concentrated to give the crude product as a yellow glass. The crude product was purified by preparative TLC (5% Et<sub>2</sub>O in CH<sub>2</sub>Cl<sub>2</sub>) to afford the title compound as an off-white solid. NMR (400 MHz, CDCl<sub>3</sub>) δ 8.94 (s, 1H), 7.74 (s, 2H), 7.36-7.37 (d, 1H), 7.19-7.25 (m, 4H), 6.75-6.77 (d, 1H), 6.61-6.64 (dd, 1H), 6.54-6.55 (d, 1H), 4.40-4.46 (q, 2H), 4.30-4.33 (t, 1H), 4.05-4.08 (d, 1H), 3.95-3.98 (d, 1H), 2.98-3.06 (m, 1H), 2.81-2.88 (m, 1H), 2.42-2.51 (m, 1H), 1.88-1.96 (m, 1H), 1.41-1.45 (t, 3H). EXAMPLE 6

N-[3,5-Dichloro-4-(3-cyclopropylmethanesulfonyl-4-hydroxy-phenoxy)-phenyl]-oxamic  
acid ethyl ester

Step A

On cooling with an ice bath, 2,6'-dichloro-4-methoxy-4'-nitrodiphenyl ether  
(5g, 16 mmol) was added portionwise to chlorosulfonic acid (14 g, 120 mmol). The  
resulting reddish-brown solution was allowed to warm to RT and stirred at RT for 1h.  
The reaction mixture was added dropwise into ice water (200 mL), extracted with  
EtOAc (3x 200 mL), dried and concentrated to give a tan solid. The solid was added  
in portions to a solution of  $\text{Na}_2\text{SO}_3$  (6g, 48 mmol) in  $\text{H}_2\text{O}$  (12 mL). The solution was  
made basic by addition of 32% aqueous NaOH and the pH was adjusted to 9.0. After  
stirring at 65°C for 2 h then at 25°C for 19 h, the solution was acidified with 1N HCl  
and a precipitate formed. The precipitate was collected by filtration, washed with  
water and dried to afford the product. MS Calc.: 377.0 Found: 376.1 (M-1).

Step B

To a solution of sodium ethoxide (0.29 mmol) in EtOH at RT was added 2-  
methoxy-4-(2,6'-dichloro-4'-nitro-phenoxy)-benzenesulfonic acid (100 mg, 0.26  
mmol), the product of Step A, and cyclopropylmethyl bromide (143 mg, 1.1 mmol).  
The resulting mixture was stirred at reflux for 18 h and cooled to RT. To the solution  
was added 1N HCl (5 mL), followed by extraction with EtOAc (3 x 10 mL). The  
combined extracts were dried and concentrated. The crude product was purified by  
preparative TLC (EtOAc:Hex, 1:1) to give a solid. MS Calc.: 431.0, Found: 431.0  
(M).

After stirring at RT, following the addition of the first equivalent of methyl iodide, the reaction mixture was recooled to 0°C and an additional portion of lithium hexamethyldisilazane (6.2 mL) was added. After 45 min, methyl iodide (0.4 mL) was

added and the resulting mixture was allowed to stir at RT for 3 h. The reaction was quenched with saturated aqueous ammonium chloride, extracted with ethyl acetate, the organic layer dried over sodium sulfate and concentrated to a dark oil. Flash chromatography (hexanes:chloroform) afforded 2,2-dimethyl-4,7-dimethoxyindan-1-one (1.0 g) as a brown oil.

Step C

To a cooled (-78°C), stirred solution of 2,2-dimethyl-4,7-dimethoxyindan-1-one (1 g) in dichloromethane (20 mL) was added boron trichloride (9 mL of a 1M solution in dichloromethane) over a 5 min period. The reaction was allowed to warm to RT, stirred for 3 h, then recooled to -78°C, quenched with ice, allowed to warm to RT and stirred for 1 h. The reaction was extracted with dichloromethane, the organic layers dried over sodium sulfate, concentrated in vacuo and flash chromatographed to afford 2,2-dimethyl-7-hydroxy-4-methoxyindan-1-one (0.85 g) as a tan oil.

Step D

To a stirred solution of 2,2-dimethyl-7-hydroxy-4-methoxyindan-1-one (500 mg) and methanesulfonic acid (466 mg) in dichloromethane (12 mL) was added triethylsilane (564 mg). Every 0.5 h, over a 3 h period, additional portions of methanesulfonic acid and triethylsilane were added. The reaction was partitioned between water and dichloromethane, the organic layer dried over sodium sulfate, concentrated in vacuo and the resulting oil flash chromatographed (1:1, chloroform:hexanes) to afford 2,2-dimethyl-7-hydroxy-4-methoxyindane (230 mg) as a colorless waxy solid.

Step A

To a cooled (-78°C), stirred solution of 5-(2-chloro-6-methyl-4-nitro-phenoxy)-2-methoxy-benzaldehyde (10 g) in dichloromethane (300 mL) was added boron tribromide (23.3 g) dropwise. The reaction was allowed to warm to ambient temperature, stirred for 1.5 h, ice was added to quench the reaction and work up was done with ethyl acetate/water. The organic layer was dried over sodium sulfate, concentrated in vacuo and the resulting oil filtered through a plug of silica gel (eluting with chloroform) to afford 5-(2-chloro-6-methyl-4-nitro-phenoxy)-2-hydroxy-benzaldehyde (8.65 g) as an off-white solid.

60122222.030199

Step B

Trimethylsiloxyethoxymethyl chloride (5.59 g) was added and stirring was continued for 16 h. The reaction was quenched with half-saturated ammonium chloride, extracted with ethyl acetate, the combined organic layers dried over sodium sulfate and concentrated *in vacuo* to afford a brown oil.
